

Project Report Template

1. INTRODUCTION

1.1 Overview

Global warming is one of the biggest challenges currently being faced by the human race, although correlation is not causation, a likely cause of global warming is due to increased atmospheric carbon dioxide from human activities. **CO2 Emission** refers to the Carbon Dioxide emitted throughout the world. For this analysis we will be focusing on CO2 Emissions and its effect on the world we live in as well as some key factors and stats that may play a role in the emission of CO2 globally. Fossil fuel use is the primary source of CO2. The data throws light onto how much fossil fuels are burnt, per year per nation, which amounts to an increase in CO2 every year. This will help researchers and environment experts to predict global warming. So countries should set a goal to decrease this amount yearly.

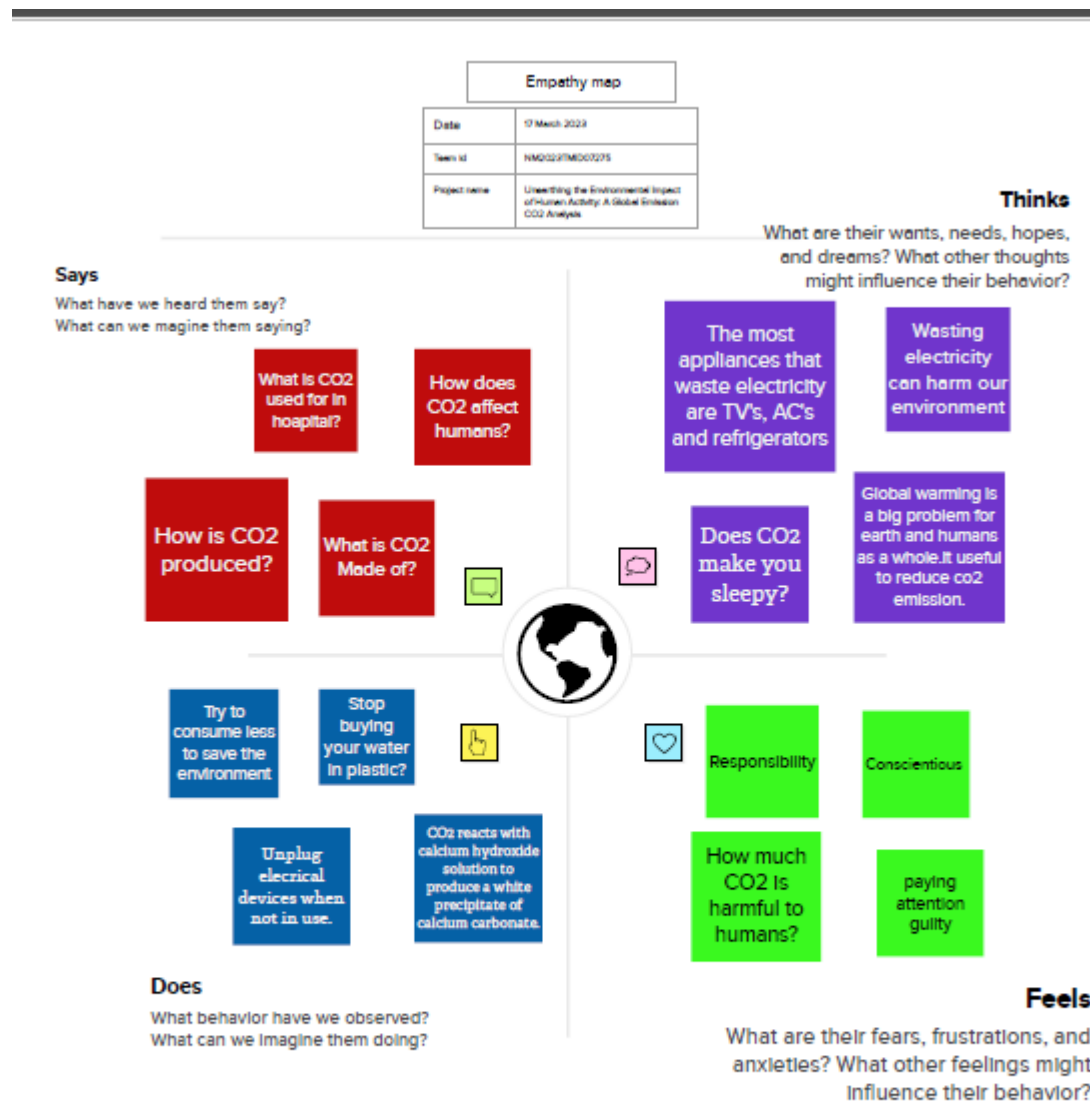

Analysing Global Co2 Emission across countries from 1975 to 2020. This dataset contains a record of Co2 Emission by each Country and Region of Earth, here we are going to analyse and visualise Country wise, Region wise and Overall Co2 Emission on Earth.

1.2 PURPOSE

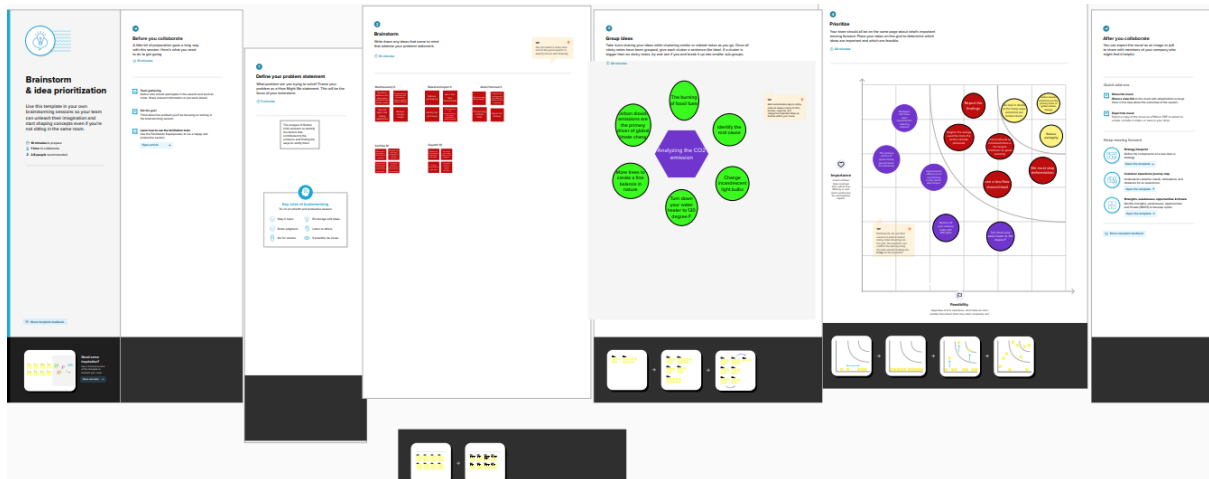

The carbon in CO2 can be used to produce fuels that are in use today, including methane, methanol, gasoline and aviation fuels.

more efficiently. More abundant vegetation from increased CO₂ is already apparent.

Reducing Greenhouse Gas Emissions Can **Improve Air Quality and Save Lives**. Reducing global greenhouse gas emissions to slow climate change could prevent millions of premature deaths due to air pollution over the next century, according a new study funded by NIEHS.

Disadvantages

Carbon dioxide is an important greenhouse gas that **helps to trap heat in our atmosphere**. Without it, our planet would be inhospitably cold. However, an increase in CO₂ concentrations in our atmosphere is causing average global temperatures to rise, disrupting other aspects of Earth's climate.

- melting glaciers;
- floods and droughts;
- loss of biodiversity;
- volcanoes erupting

6. APPLICATIONS

Global warming, which has been increasing in recent years, is due to the increasing amount of greenhouse gases in the atmosphere. The agricultural sector, which has a 25% share in greenhouse gas formation, plays an important role in global warming. CO₂, which has a share of 82% among greenhouse gases, is shown as the most important greenhouse gas. It is estimated that 10% of the CO₂ in the atmosphere is missioned from the soil. When soil organic carbon, which is an indicator of soil fertility, is released into the atmosphere as CO₂, N and S compound gases return to the earth and it causes inefficient soil as well as global warming. Organic carbon is a source of CO₂ emissions when the soil is mismanaged. The organic carbon in the soil is transformed into CO₂ with loosening of the soil and accumulates in the atmosphere, after it exposure to temperature and oxygen. Unconscious tillage and irrigations increase the physical biological

activity of the soil and cause CO₂ emissions from the soil. CO₂ emission, which is the main cause of drought, needs to be reduced with low cost, easy and practical applications.

7. CONCLUSION

- New research into how natural carbon sinks and carbon sources are influenced by climate change indicates, however, that the future net carbon uptake terrestrial systems could be less than formerly estimated.
- There are now far more studies and information about emission pathways compared to when AR4 was published. The studies inform primarily about the two-degree target, rather than even lower temperature targets.
- Measures to reduce emissions of short-lived climate forcers such as tropospheric ozone and soot may help in limiting global warming in the near term, but such measures are not sufficient to curb the warming.
- The later global emissions culminate, the lower the probability of the two-degree target being met. In order to meet the two-degree target with a relatively high probability (around 70%), global greenhouse gas emissions must peak over the next 5-10 years, and by 2050 they must have decreased by approximately 50-60% compared to 2000.
- There are different models for how global emission reductions can be distributed between different regions and countries. Such models depend on political and other standpoints.

7. FUTURE SCOPE

Essentially, scope 1 and 2 are those emissions that are owned or controlled by a company, whereas scope 3 emissions are a consequence of the activities of the company but occur from sources not owned or controlled by it.

CO₂ can also **replace fossil fuels as a raw material in chemicals and polymers**. Less energy-intensive pathways include reacting CO₂ with minerals or waste streams, such as iron slag, to form carbonates for

building materials. The future market potential for CO2-derived products and services is difficult to assess.

        <div class="row content">
            <div class="col-lg-12">
                <p>
                    Carbon dioxide emissions are those stemming from
the burning of fossil fuels and the manufacture of cement. They include carbon
dioxide produced during consumption of solid, liquid, and gas fuels and gas
flaring.
                </p>
                <p>
                    Global carbon dioxide (CO2) emissions from fossil
fuels and industry have increased considerably since 2000, and in 2019 reached
a record high of 36.7 billion metric tons of CO2. In 2020, the COVID-19
pandemic caused global CO2 emissions to plummet five
percent to 34.81 billion metric tons.</p>
                <p> Historically, major global events cause emission
reductions. The 2009 global recession caused worldwide CO2 emissions to fall
by approximately 460 million metric tons. But this pales in comparison to the
emission reductions in
                2020. Countries around the world were put under
strict lockdowns, meaning transportation and industrial activities were
significantly reduced. CO2 emission levels in India dropped for the first time
in four decades in the year
                ending March 2020. Global CO2 emissions per capita
also experienced a substantial decline in 2020, falling to an average of 4.47
metric tons per person.</p>
